R = Reagents  
S = Quantitation Standards  
W = Molecular Grade Water.

All Vials have Color Coder tops to distinguish between different reagents.

2. **Storage of the Kit.**

All the reagents of the kit should be stored at -20°C and is stable till expiry at this temperature. Repeated thawing and freezing (> 3x) should be avoided, as this may...

---

*The Rotor Gene™ 2000/3000/6000 is a registered trademark of Corbett Research, Australia.*
reduce the sensitivity of the assay. If the kit is to be used only occasionally, the reagents should be frozen in aliquots. Storage at +4°C is not recommended & should not exceed a period of 2 hours in any case.

3. *Haemophilus influenzae* Information

**Application**

*Haemophilus influenzae* is a small, non-motile Gram-negative bacterium in the family Pasteurellaceae. Naturally-acquired disease caused by *Haemophilus influenzae* seems to occur in humans only. It was first isolated by Pfeiffer during the influenza pandemic of 1890. It was mistakenly thought to be the cause of the disease influenza, and it was named accordingly.

*Haemophilus influenzae* is highly adapted to its human host. It is present in the nasopharynx of approximately 75 percent of healthy children and adults. It is rarely encountered in the oral cavity and it has not been detected in any other animal species.

In infants and young children (under 5 years of age), *Haemophilus influenzae* type b causes bacteremia and acute bacterial meningitis. Occasionally, it causes epiglottitis (obstructive laryngitis), cellulitis, osteomyelitis, and joint infections. Nontypable *H. influenzae* causes ear infections (otitis media) and sinusitis in children. Initially *H. influenzae* invades the nasopharyngeal mucosa before spreading to the lower respiratory tract where the organism invades and destroys the mucous membranes producing bronchiolitis, peribronchiolitis, and/or interstitial lesions and is associated with respiratory tract infections (pneumonia).

Samples which can be used for Extraction: C.S.F., Bronchial swabs, Bronchial lavage etc.

4. Precautions for PCR

The following aspects should always be taken care of:

- Store positive material (Specimens, Standards or amplicons) separately from all other reagents and add it to the reaction mix in a separate facility.
- Thaw all components thoroughly at room temperature before starting the assay.
- When thawed, mix the components and centrifuge briefly.
- Work quickly on ice or in the Cooling Block.
- All the reagents including the NTC (except for standards & specimens) should be mixed & dispensed in pre-mix area.
Geno-Sen’s Haemophilus influenzae Real Time PCR Kit for Rotor Gene 2000/3000/6000

- All the standards & specimens should be mixed & dispensed in extraction area.
- Use pipette tips with filters only.
- Always use disposable powder-free gloves

5. Additionally Required Materials and Devices

- DNA isolation kit (see 8.a. DNA extraction)
- 0.2 ml PCR tubes for use with 36-well rotor (Corbett Research, Cat.-Nr.: SE-1003F) alternatively 0.1 ml PCR tubes for use with 72-well rotor (Corbett Research, Cat.-Nr.: ST-1001)
- Micro Pipettes Variable Volume 2-20µl, 10-100µl, 100-1000µl,
- Sterile pipette tips with aerosol barrier 2-20µl, 10-100µl, 100-1000µl,
- Disposable powder-free gloves
- Vortex mixer
- Centrifuge Desktop with rotor for 1.7 ml reaction tubes
- Rotor Gene™ 2000/3000 or Rotor Gene™ 6000, Corbett Research (The Real time PCR Instrument)

6. Principle of Real-Time PCR

The robust assay exploits the so-called Taqman principle. During PCR, forward and reverse primers hybridize to a specific sequence product. A TaqMan probe, which is contained in the same reaction mixture and which consists of an oligonucleotide labeled with a 5’-reporter dye and a downstream, 3’-quencher dye, hybridizes to a target sequence within the PCR product. A Taq polymerase which possesses 5’ - 3’ exonuclease activity cleaves the probe. The reporter dye and quencher dye are separated upon cleavage, resulting in an increase in fluorescence for the reporter. Thus, the increase in fluorescence is directly proportional to the target amplification during PCR.

7. Description Of the Product.

The Geno-Sen’s Haemophilus influenzae PCR Reagents constitute a ready to use system for detection and quantification of Haemophilus influenzae using Polymerase chain reaction (PCR) in the Rotor Gene 2000/3000/6000 (Corbett Research). The Specific Master mix contains reagents and enzymes for the specific amplification of Haemophilus influenzae and for the direct detection of the specific amplicon in fluorescence channel Cycling A.FAM of the Rotor Gene 2000/3000/6000 & the Reference gene on Cycling A. Joe. External positive Standards (H. Inf S 1-5) are
supplied which allow the determination of the gene load. For further information, please refer to section 8.c Quantitation.

8. Procedure

8.a DNA Extraction

DNA Extraction kits are available from various manufacturers. Sample volumes for the DNA Extraction procedure depend on the protocol used. Please carry out the DNA Extraction according to the manufacturer’s instructions. The recommended Extraction kits are the following:

<table>
<thead>
<tr>
<th>Sample Material</th>
<th>Nucleic Acid Isolation Kit</th>
<th>Acid Cat. Num.</th>
<th>REF Cat. Num.</th>
<th>Manufacturer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serum or plasma.</td>
<td>QIAamp Blood DNA Mini extraction Kit (50)</td>
<td></td>
<td>51104</td>
<td>QIAGEN</td>
</tr>
<tr>
<td></td>
<td>OR</td>
<td></td>
<td></td>
<td>Bioneer</td>
</tr>
<tr>
<td></td>
<td>Genomic DNA extraction kit 100 rxns of Bioneer</td>
<td>K-3032</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

However the customer can use their own extraction systems depending on how good the yield is. Always use an extraction kit with a higher DNA yield.

Blood collection tubes coated with anticoagulants may inhibit the PCR, However these inhibitors will be eliminated by the use of the isolation kits given above. It is recommended to avoid the usage of heparin blood.

When using Extraction protocols with ethanol-containing washing buffers, please carry out an additional centrifugation step before the elution to remove any remaining ethanol. This prevents possible inhibition of PCR.

The *Haemophilus influenzae Rotor Gene PCR Reagents* should not be used with phenol based isolation methods.

8.b Inhibition Control:

Inhibition Control Gene allows the user to determine & control possible PCR inhibition. The Inhibition Control gene reagents are in built in the premix provided and need not be run separately. There is need to add internal control Gene in the
reaction mix which has been provided as IC-1 RG (R3). To add the IC Gene 0.5µl/rxn of R3 is added to the premix as shown in the Figure 4 & 5. The results can be visualized in the Joe channel.

8.c Quantitation

The quantitation standards provided in the kit (H. Inf. S 1-5) are treated in the same way as extracted samples and the same volume is used i.e. (10µl) instead of the sample. To generate a standard curve in the RotorGene™ 2000/3000/6000, all 5 Standards should be used as defined in the menu window Edit Samples of the RotorGene™ software. The same should also be defined as standards with the specified concentrations (see RotorGene™ Manual). The standard curve generated as above can also be used for quantitation in subsequent runs, provided that at least one standard is used in the current run. For this purpose, the previously generated standard curve needs to be imported (see Rotor Gene™ 2000/3000/6000 Manual). However, this quantitation method may lead to deviations in the results due to variability between different PCR runs & due to varying Reaction efficiencies.

Attention: The standards are defined as copies/µl. The following formula has to be applied to convert the values determined using the standard curve into Copies/ml of sample material:

\[
\text{Result (Copies/ml)} = \frac{\text{Result (Copies/µl)} \times \text{Elution Volume (µl)}}{\text{Sample Volume (ml)}}
\]

Or else direct conversion can be done keeping in mind the starting volume of the sample & the final eluted Volume e.g.

If the starting volume of the sample while using the QIAamp DNA Mini extraction kit is 200µl & the final Eluted Volume is 50µl then to obtain the direct values i.e. copies/ml for the patient samples the following values for the standards can be fed directly into the operating software which is again based on the above formula and will yield direct conversion of per ml of patient sample data.

<table>
<thead>
<tr>
<th>Standard</th>

Preparation for PCR

8. d. Preparation for PCR amplification:
First make sure that the Cooling Block (accessory of the Rotor Gene™, Corbett Research) is pre-cooled to +4°C in a Refrigerator or Deep Freezer. Place the desired number of PCR tubes into the Cooling Block. Make sure that the tubes for standards & at least one negative control (Water, PCR grade) are included per PCR run. To generate a standard curve, use all supplied Standards (H. Inf S 1-5) for each PCR run. Before each use, all reagents need to be thawed completely and mixed (by pipetting or by brief vortexing).

Please follow the pipetting scheme mentioned below for each sample depending upon the number of samples a mix can be prepared as follows. Each sample

![Diagram of PCR mixture preparation]

Fig. 4.
Depending upon the number of samples the following pipetting scheme can be followed. e.g. for 10 rxns.

<table>
<thead>
<tr>
<th>Haemophilus influenzae MASTER MIX</th>

</tbody>
</table>

Fig. 5.

Pipette 15 μl of the Master Mix into each labelled PCR tube. Then add 10 μl of the earlier extracted DNA to each sample tube and mix well by pipeting up and down. Correspondingly, 10 μl of the Standards (H. Inf. S1-5) must be used as a positive control and 10 μl of water (Water, PCR grade) as a negative control. Close the PCR tubes and transfer the Haemophilus influenzae tubes into the rotor of the RotorGene™ instrument. The RotorGene™ software versions 5.0.53 and higher require a Locking Ring (accessory of the RotorGene™, Corbett Research) to be placed on top of the rotor to prevent accidental opening of the tubes during the run.

8.e. Programming the RotorGene™ 2000/3000

The RotorGene™ 2000/3000 PCR program for the detection of Haemophilus influenzae can be divided into following steps:

A. Setting of general assay parameters & reaction volume
B. Thermal Profile & Calibration
C. Cycling profile/ & Initial activation of the Hot Start enzyme
D. Cycling for Amplification of DNA
E. Adjustment of the sensitivity of the fluorescence channels
F. Starting of the Rotor Gene™ run

Program the RotorGene™ 2000/3000 for these 5 steps according to the parameters shown in Fig. 6-20. All specifications refer to the RotorGene™ software version 6.0.33. Please find further information on programming the RotorGene™ in the RotorGene™ 2000/3000 Operator’s Manual. In the illustrations these settings are shown by arrows.
Setting of general assay parameters & Reaction volume.

First, confirm whether the PCR tubes used are No Domed PCR tubes by clicking in the box as shown in the figure. Please note that tubes with domes cannot be used in Rotor gene hence click in the box as shown below.

![Fig. 6. Confirmation of Reaction Volume as follows.](image)

**Fig. 6.** Setting of general assay parameters.

![Fig. 7. Setting of general assay parameters.](image)

**Fig. 7.** Setting of general assay parameters.

- Please click on the volume buttons to make sure that 25µl is reflected in the window as shown above.
- Then click next and a new window will open as shown below.
THERMAL PROFILE & CALIBRATION:

Here the thermal profile for the assay will be defined.

Fig. 8.

Programming the temperature profile is done by activating the button *Edit Temperature Profile* in the next *New Experiment Wizard* menu window as shown above.

CYCLING PROFILE: First hold 95°C for 10 minutes as below

Fig. 9. Initial activation of the Hot Start enzyme.
Setting up of denaturation step in the cycling profile as depicted below i.e. 95°C for 15 seconds.

Fig. 10.

Setting up of Anneling step in the cycling profile as depicted below i.e. 55°C for 20 Seconds and defining the Data acquiring channel i.e FAM & JOE

Fig. 11.
Setting up of Extension step in the cycling profile as depicted below i.e. 72°C for 15 Seconds

Fig. 12.

Setting up of Number of Cycles to 45 cycles in the cycling profile as depicted below.

Fig. 13.
Final Confirmation of the Thermal profile by pressing OK button as shown below.

Fig. 14.

Setting the gains for the acquiring channel by clicking at the Calibrate button as shown below.

Fig. 15.

The detection range of the fluorescence channels has to be determined according to the fluorescence intensities in the PCR tubes. This adjustment is done in the menu window Auto Gain Calibration.
Setup (activation in menu window \textit{New Experiment Wizard} under \textit{Calibrate}). Please set the calibration temperature to the annealing temperature of the amplification program (compare Fig. 16).

\textbf{Adjustment of the fluorescence channel sensitivity as shown below.}

Please do not forget to click on the box against “Perform calibration at 55°C at beginning of the run.” After that press Close and a new window will open as shown below.
The gain values determined by the channel calibration are saved automatically and are listed in the last menu window of the programming procedure.

PRESS NEXT

Fig. 18.

Starting of the Rotor Gene™ run.

Fig. 19:
Press Start Run Button.
SAVING THE RUN FILE AS ABOVE

Store the run file either in my documents or a designated folder as shown above. The moment save button is clicked after the file name, machine will start.

8.f. Programming the RotorGene™ 6000

The RotorGene™ 6000 PCR program for the detection of Haemophilus influenzae can be divided into following steps:

G. Setting of general assay parameters & reaction volume
H. Thermal Profile & Calibration
I. Cycling profile/ & Initial activation of the Hot Start enzyme
J. Cycling for Amplification of DNA
K. Adjustment of the sensitivity of the fluorescence channels
L. Starting of the Rotor Gene™ run

Program the RotorGene™ 6000 for these 5 steps according to the parameters shown in Figures 21-36 below. All specifications refer to the RotorGene™ 6000 software version 1.7. Please find further information on programming the RotorGene™ in the RotorGene™ 6000 Operator’s Manual. In the illustrations these settings are shown by arrows.
g) Setting of general assay parameters & Reaction volume.

Please see to it that you in advanced mode and then click Hydrolysis Probes. On a double click the software will automatically go to the next function. If there is just a single click then click new after highlighting the Hydrolysis Probes.

First, confirm by clicking in the box as shown in the figure above whether a locking ring has been attached. Then click next to proceed to the next step.
Confirmation of reaction Volume as follows.

- Please click on the volume buttons to make sure that 25µl is reflected in the window as shown above.
- In case required Operators Name can be Fed into the system.
- Any Notes which need to be either printed into the Report can be typed out in the Box of Notes.
- Then click next and a new window will open as shown below.

**h) THERMAL PROFILE & CALIBRATION:**

Here the thermal profile for the assay will be defined.

Fig. 24.
Programming the temperature profile is done by activating the button *Edit Profile* in the next *New RUN Wizard* menu window as shown above.
i) CYCLING PROFILE: First hold 95°C for 10 minutes as below

![Cycling Profile](image)

**Fig. 25.** Initial activation of the Hot Start enzyme. Generally the window will open with the Hold Temp as 95°C and the Hold Time as 10 minutes. In case it is different then set the same to as shown above.

j) Setting the Cycling and acquisition.

When clicked on Cycling the window will open as below.

![Cycling and Acquisition](image)

**Fig. 26.**

Click on the Plus sign at the right hand as shown in the figure to make the Cycling a three step process. A new window as shown below will be there.
Setting up of denaturation step in the cycling profile as depicted below i.e. 95°C for 15 seconds.

Fig. 27.

Setting up of Anneling step in the cycling profile as depicted below i.e. 55°C for 20 seconds.

After setting the Anneling temperature and the time for annealing click on the “Acquiring to Cycling A” as shown by arrow. A New window will open as shown below.

Fig. 28.
Defining the Data acquiring channel i.e Green (FAM) & Yellow (JOE)

Highlight the Yellow and then press the right arrow. Just see before shifting the yellow to right that there is no other channel in the right except for Green. In case any other Channel appears besides Green on the right then the same be shifted to the left.

Confirmation of Channels as shown below.

Once the Yellow and Green Channels are on the Right side then press OK as shown by the arrow.
Setting up of Extension step in the cycling profile as depicted below i.e. 72°C for 15 Seconds

![Fig. 31.](image)

Setting up of Number of Cycles to 45 cycles in the cycling profile as depicted below.

![Fig. 32.](image)

After setting the number of Cycles Press OK.
k) Setting the gains for the acquiring channel by clicking at the Gain Optimisation button as shown below.

![Fig. 33](image)

The detection range of the fluorescence channels has to be determined according to the fluorescence intensities in the PCR tubes. This adjustment is done in the menu window **Auto Gain optimization Setup** (activation in menu window **New Experiment Wizard** under Gain Optimization). Please set the temperature to the annealing temperature of the amplification program (compare Fig.34).

![Fig. 34](image)

The following needs to be done.

- Click on the Optimise Acquiring
- Click on Set temperature To Adjust the Temperature to 55°C
- Click on the Box Perform Optimisation At 55 degree At beginning of Run
- Just see that below the channel settings there appear only two channels i.e. Green and Yellow. In case it is different then the channels have not been set properly. Close the window and reset the channels.
- Then Press Close.
L) PRESS Start RUN

Fig. 35.

Saving the RUN File.

Fig. 36.

Store the run file either in my documents or a designated folder as shown above. The moment save button is clicked after the file name, machine will start.
9. a) Generated Data Interpretation & Analysis for Rotor Gene 2000/3000

Data analysis is performed with the RotorGene™ software according to the manufacturer’s instructions (RotorGene™ 3000 Operator’s Manual).

The following results are possible:

1. A signal is detected in fluorescence channel Cycling A.FAM.

The result of the analysis is positive: The sample contains *Haemophilus influenzae* DNA.

2. In fluorescence channel Cycling A.FAM no signal is detected. 

No *Haemophilus influenzae* DNA detectable. It can be considered negative if there is amplification in the Joe Channel. Please refer for details on PCR inhibition in the section PCR inhibition.

Fig. 37: Detection of the quantitation standards (*H. Inf. S 1-5*) in fluorescence channel Cycling A.FAM. NTC: non-template control.

Examples of positive and negative PCR reactions are given in the above figure.
Fig. 38.

Example of analysed data for *Haemophilus influenzae* where all the amplification curves can be seen as well as the standard curve, reaction efficiency, M value etc. can be seen and the quantitative data for the samples can be seen.

**Inhibition Control gene amplification.**

**Analyze the Joe Channel**

**PCR Inhibition**

A signal is detected in fluorescence channel Cycling A. Joe: No PCR inhibition

In fluorescence channel Cycling A. Joe no signal is detected.

But signal detected in FAM: The sample is positive for *Haemophilus influenzae* DNA.

In fluorescence channel Cycling A. Joe no signal is detected.

No signal detected in FAM as well: A possible PCR inhibition has occurred.

9. b) Generated Data Interpretation & Analysis for Rotor Gene 6000

Data analysis is performed with the *RotorGene™* software according to the manufacturer’s instructions (RotorGene™ 6000 Operator's Manual).

The following results are possible:
3. A signal is detected in fluorescence channel Cycling A.Green.

The result of the analysis is positive: The sample contains *Haemophilus influenzae* DNA.

4. In fluorescence channel Cycling A.Green no signal is detected. **No Haemophilus influenzae** DNA detectable. It can be considered negative if there is amplification in the Yellow Channel. Please refer for details on PCR inhibition in the section PCR inhibition.

Fig. 39: Detection of the quantitation standards (*H. Inf. S 1-5*) in fluorescence channel Cycling A.Green. NTC: non-template control.

Examples of positive and negative PCR reactions are given in the above figure.
Example of analysed data for *Haemophilus influenzae* where all the amplification curves can be seen as well as the standard curve, reaction efficiency, M value etc. can be seen and the quantitative data for the samples can be seen.

**Inhibition Control gene amplification.**

**Analyze the Yellow Channel**

**PCR Inhibition**

A signal is detected in fluorescence channel Cycling A. Yellow: **No PCR inhibition**

In fluorescence channel Cycling A. Yellow no signal is detected.

**But signal detected in Green: The sample is positive for *Haemophilus influenzae* DNA.**

In fluorescence channel Cycling A. Yellow no signal is detected.

**No signal detected in Green as well: A possible PCR inhibition has occurred.**

10. **a) Troubleshooting RotorGene 2000/3000**

1. No signal with positive Standards (H. Inf.S 1-5) in fluorescence channel Cycling A.FAM.
• Incorrect programming of the Rotor-Gene™ 2000/3000.
  ➔ Repeat the PCR with corrected settings.

2. Weak or no signal in fluorescence channel Cycling A. FAM:

• The PCR conditions do not comply with the protocol.
  ➔ Repeat the PCR with corrected settings.

• The *Haemophilus influenzae* Super Mix R1 has been thawed and frozen too often.
• The *Haemophilus influenzae* Super Mix R1 has been kept at +4°C for longer than 5 hours.
  ➔ Please mind the storage conditions given in the Storage.
  ➔ Repeat the assay using a new *Haemophilus influenzae* super mix (R1).

• The PCR was inhibited.
  ➔ Make sure that you use a recommended extraction method (see 8.a. DNA extraction) and stick closely to the manufacturer’s instructions.
  ➔

10. b) Troubleshooting RotorGene 6000

1. No signal with positive Standards (H. Inf. S 1-5) in fluorescence channel Cycling A. Green.

• Incorrect programming of the Rotor-Gene™ 6000.
  ➔ Repeat the PCR with corrected settings.

2. Weak or no signal in fluorescence channel Cycling A. Green:

• The PCR conditions do not comply with the protocol.
  ➔ Repeat the PCR with corrected settings.
• The *Haemophilus influenzae* Super Mix *R1* has been thawed and frozen too often.

• The *Haemophilus influenzae* Super Mix *R1* has been kept at +4°C for longer than 5 hours.

➤ Please mind the storage conditions given in the **Storage**.

➤ Repeat the assay using a new *Haemophilus influenzae* super mix (*R1*).

• **The PCR was inhibited.**

➤ Make sure that you use a recommended extraction method (see 8.a. DNA extraction) and stick closely to the manufacturer’s instructions.

11. **Specifications**

11.a **Sensitivity and Reproducibility**

In order to determine the sensitivity of the **Geno-Sen’s Haemophilus influenzae Real Time PCR Kit**, a dilution series has been set up from $10^6$ down to $10^0$ Copies/µl of *Haemophilus influenzae* DNA and analyzed with the **Geno-Sen’s Haemophilus influenzae Real Time PCR Kit**. The assays were carried out on three different days in the form of 8-fold determinations. The results were determined by a probit analysis. The detection limit as determined for **Geno-Sen’s Haemophilus influenzae Real Time PCR Kit** is consistently 80 copies/ml. This means that there is 95% probability that 80 copies/ml will be detected.

11.b **Specificity**

In order to check the specificity of the **Geno-Sen’s Haemophilus influenzae Real Time PCR kit**, different DNA & RNA listed below were analyzed with **Geno-Sen’s Haemophilus influenzae Real Time PCR Kit**. None of these led to a positive signal with the **Geno-Sen’s Haemophilus influenzae Real Time PCR Kit**. Gene sequence analysis of the amplified region of *Haemophilus influenzae* shows a pronounced homology among the various *Haemophilus influenzae* subtypes, and no homology with other DNA. Besides which utmost care has been taken in selection of the primers & probes being used in the kit.

Further studies are underway on this aspect.

12. Warranty:

Products are guaranteed to confirm to the quality and content indicated on each vial and external labels during their shelf life. Genome Diagnostics Pvt. Ltd. obligation and purchaser’s rights under the warranty are limited to the replacement by Genome Diagnostics Pvt. Ltd of any product that is shown defective in fabrication, and that must be returned to Genome Diagnostics Pvt. Ltd Freight prepaid, or at Genome Diagnostics Pvt. Ltd. option, replacement of the purchasing price. Any complaint on damaged goods during transport must be directed to the handling or transport agent.

*In Vitro* Diagnostic Medical device, as per the Directive 98/79/EC specifications. This product must be used by qualified professionals only. It is the responsibility of the user to ascertain that a given product is adequate for a given application. Any product not fulfilling the specifications included in the product sheet will be replaced. This warranty limits our responsibility to the replacement of the product. No other warranties, of any kind, express or implied, including without limitation, implicit warranties of commercialization ability or adequacy for a given purpose, are provided by Genome Diagnostics Pvt. Ltd. Genome Diagnostics Pvt. Ltd will not be responsible for any direct, indirect, consequential or incidental damage resulting of the use, misuses, results of the use or inability to use any product.

13. Limitations of product use:

a.) All reagents may exclusively be used for *in vitro* diagnostics.

b.) The product is to be used by personnel specially instructed and trained in for the *in-vitro* diagnostics procedures only.

c.) It is important to pipet the indicated quantities, and mix well after each reagent addition. Check pipettes regularly.

d.) Instructions must be followed Correctly in order to obtain correct results. If the user has any questions, please contact our Technical Dept. ([dharam@vsnl.com](mailto:dharam@vsnl.com)) or at [pbpl@vsnl.net](mailto:pbpl@vsnl.net).

e.) This test has been validated for use with the reagents provided in the kit. The
use of other Reagents or methods, or the use of equipment not fulfilling the specifications, may render equivocal results. User is responsible for any modifications done in any of the indicated parameters. Compliance with the kit protocol is required.

f.) Detection of bacterial DNA depends on the number of DNA present in the sample, and can be affected by sample collection methods, patient-related factors (e.g. age, symptoms), or for infection stage and sample size.

g.) False negative results may be obtained due to polymerase inhibition. It is recommended to perform control reactions to distinguish between inhibition and true negatives. This is achieved by the inhibition Control included in the kit.

h.) Cross contamination between samples and exogenous DNA can only be avoided by following good laboratory practice. Instructions in this document must be strictly followed.

i.) Attention should be paid to expiration dates printed on the kit box and labels of all components. Do not use expired components.

If you have any further questions or problems, please contact our technical support at dharam@vsnl.com OR pbpl@vsnl.net.
